

INTRODUCING LAYFIELD'S NEWEST MANUFACTURED PRODUCT LINE.

Building on over 40 years of excellence and innovation in geomembrane manufacturing, Layfield now manufactures a wide range of geonet and geocomposite products under our HydraNet™ brand of drainage products. Layfield's HydraNet™ is designed as a cost-effective and environmentally-conscious alternative to aggregate drains for a variety of applications. It can effectively transmit fluids and gasses while taking up much less space compared to a sand, stone, or gravel layer. In double-lined containment applications, it is commonly used to create a void between two geomembrane liners as part of a leak detection system. HydraNet™ geocomposites have a geotextile bonded to one or both sides of a geonet. The addition of laminated geotextile layers prevents the movement of soil fines into the drainage path that could otherwise lead to clogging and reduced drainage performance longer term. Layfield's HydraNet™ geonet is made in North America at our ISO 9001 certified facility.

Call your Layfield representative today for a complete solution to your containment and drainage needs. **Complete manufactured solutions for your peace of mind.**
